

AdamyA Computing Technologies Private Limited

A company specializing in Embedded Wireless products.

The product: AdamyA has created a robust mechanism (IP Protection Scheme, IPPS) to protect embedded software IP. Completely conceptualized and developed in-house, the product was developed primarily to protect the company’s own embedded wireless software IP, which was widely deployed.

The innovation: The embedded software has a built in security mechanism to detect at run-time, whether it is an authorized copy or not. If it is not an authorized copy, it can “self-destruct” the embedded software and prevent further usage of the system.

Product highlights

- The software helps control the number of authorized copies of the embedded software produced, prevents illegal usage of the embedded software and disallows its illegal copying.
- The mechanism has been deployed in AdamyA’s Bluetooth® based embedded products.
- AdamyA’s IPPS is a patented innovation.
